Comments: Good day.

I object to the current logging, cutting , and burning plan of the Encino Vista Project.

A full EIS is necessary. Other options need be considered for considerable damage will occur under the current plan. Caution rules for responsible parties need be held responsible. Worse is that the complex system cannot be "restored" nor replaced so easily.

Diversity rules in the forest. The trees are but the canopy. Our air ,cleansed even by lichen, is so jeopardized in burns, as is all life which depends on water and air and nutrients

Scorching days are even worse with climate change. The trees in all their forms help shade the organisms below. That is where life thrives. Soil is the richness of our forests.

Uncertain times call for precaution. From the Dog Fire masticator fire in the Manzanos to the Hermit's Peak prescribed burns we must learn from the past and not just do bigger prescribed burns as the " remedy".
